The outcome of the project is a series of videos and accompanying data collected during experiments conducted in physical models of steelmaking operations. All of the experimental information as well as the results will be available through a dedicated website.

To date, we have built the physical models and completed all of the experimental work. We are in the final phase of editing the videos and uploading them to a website.

The students that participated in the second year of the project were Ricardo Agustín Sánchez-Mancera and Alfredo Fuentes-Nuñez.

We have completed the experiments with a third physical model of a continuous casting tundish.
